

Determination of Pesticide Residues in Blueberries by AOAC QuEChERS Approach and Dispersive SPE Cleanup with a Novel Sorbent ChloroFiltr®

UCT Part Numbers

ECMSSA50CT-MP

Mylar pouch containing 6 g
MgSO₄ and 1.5 g NaOAc
with 50-mL centrifuge
tubes included

CUMPSGGC182CT

2 mL centrifuge tube containing
150 mg MgSO₄, 50 mg PSA, 50
mg C18, and 50 mg ChloroFiltr®

SLAQ100ID21-3UM

Selectra® Aqueous C18,
100 x 2.1 mm, 3 µm

SLAQGDC20-3UM

Selectra® Aqueous C18,
Guard column, 10 x 2.1 mm, 3 µm

SLGRDHLDR-HPOPT

Guard Cartridge Holder

Summary:

Blueberry has been ranked as one of the healthiest fruits for its high antioxidant content that helps combating free radicals, which could damage DNA and cellular structures [1]. Application of pesticides during plant cultivation is common to increase product yield, therefore it is valuable developing effective analytical methods for the determination of pesticide residues in blueberries, which however is challenging due to matrix complexity as blueberries are rich in anthocyanins, sugars, polyphenols, vitamins, minerals, and other interfering components.

This application outlines a simple, fast, and cost-effective method for the determination of multi-class pesticides, including one of the most problematic pesticides, pymetrozine in blueberries. The acetate buffered AOAC QuEChERS protocol demonstrated higher extraction efficiency for pymetrozine than the other 2 QuEChERS protocols (the EN citrate buffered or the original unbuffered), thus was selected for the extraction of pesticide residues in blueberries. 15 g of homogenized blueberries were extracted with 15 mL of acetonitrile (MeCN) containing 1% acetic acid (HAc). 6 g magnesium sulfate (MgSO₄) and 1.5 g sodium acetate (NaOAc)

were employed to enhance phase separation and partition of pesticides into the MeCN layer. After shaking and centrifugation, 1 mL of the supernatant was transferred to a 2-mL dSPE tube containing the optimized cleanup sorbents of 150 mg MgSO₄, 50 mg PSA, 50 mg C18, and 50 mg ChloroFiltr®. Residual water was absorbed by MgSO₄, anthocynins, polyphenols, sugars and organic acids were removed by PSA, lipids and other non-polar interferences were retained by C18, while chlorophylls were removed by ChloroFiltr®, resulting in clean extract for LC/MS/MS analysis. UCT's aqueous C18 HPLC column was used for analyte retention and separation, which showed superior retention especially for several very polar pesticides, such as methamidophos and acephate.

Procedure:

1. QuEChERS Extraction

- Weigh 15 ± 0.3 g of homogenized blueberry sample into 50-mL centrifuge tubes.
- Add triphenyl phosphate (TPP) as internal standard (IS) (optional), and appropriate amounts of spiking solution to fortified samples.
- Add 15 mL of MeCN with 1% HAc. Cap and shake for 1 min at 1000 strokes/min using a Spex 2010 Geno-Grinder.
- Add salts (6 g MgSO_4 and 1.5 g NaOAc) from pouch (ECMSSA50CTMP) to the 50-mL tube, and vortex for 10 sec to break up salt agglomerates.
- Shake for 1 min at 1000 strokes/min using the Geno-Grinder.
- Centrifuge at 3000 rcf for 5 min.

2. dSPE Cleanup

- Transfer 1 mL of the supernatant to a 2-mL dSPE tube (CUMPSGGC182CT).
- Shake for 1 min at 1000 strokes/min using the Spex 2010 Geno-Grinder.
- Centrifuge at 3000 rcf for 5 min.
- Transfer 0.2 mL of the cleaned extract into a 2-mL auto-sampler vial, add 0.2 mL of reagent water, and vortex for 30 sec.
- The samples are ready for LC-MS/MS analysis.

LC-MS/MS Parameters

Results:

Selection of dSPE cleanup sorbents:

Different sorbent mixtures (A - E) were packed in 2-mL dSPE centrifuge tubes for blueberry extract cleanup:

- A. 150 mg MgSO₄ and 50 mg PSA
- B. 150 mg MgSO₄ and 150 mg PSA
- C. 150 mg MgSO₄, 50 mg PSA, and 50 mg C18
- D. 150 mg MgSO₄, 50 mg PSA, 50 mg C18, and 7.5 mg GCB
- E. 150 mg MgSO₄, 50 mg PSA, 50 mg C18, and 50 mg ChloroFiltr®

Photographs, from left to right: crude blueberry extract, and extracts cleaned with sorbent mixture A, B, C, D, and E, respectively.

Illustrated in the above picture, cleanup of blueberry extracts with PSA only (A and B) or PSA and C18 (C) is inefficient for complete pigment removal. With the addition of either GCB (D) or ChloroFiltr® (E), colorless extracts were obtained; therefore sorbent mixtures D and E were selected for the recovery study.

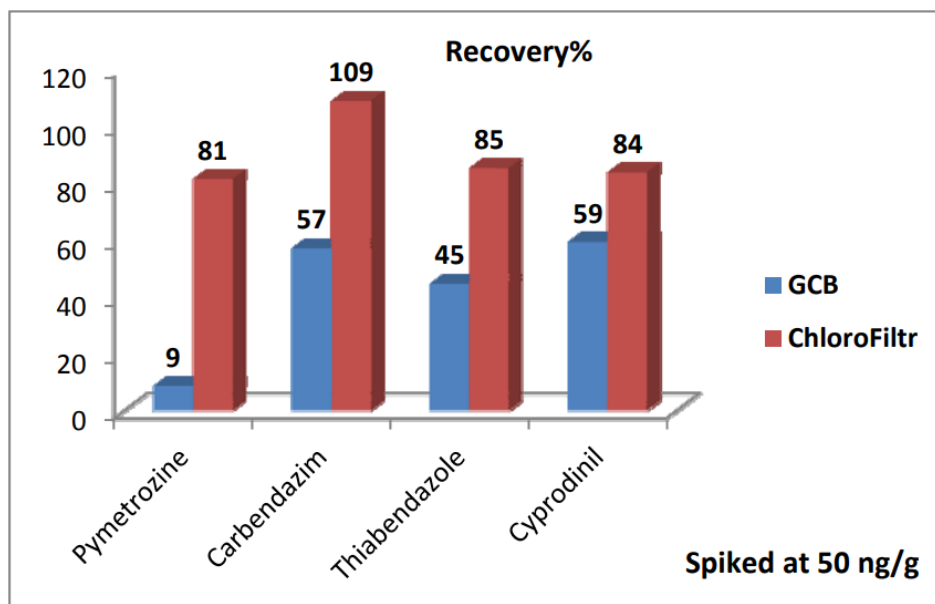

Recovery study:

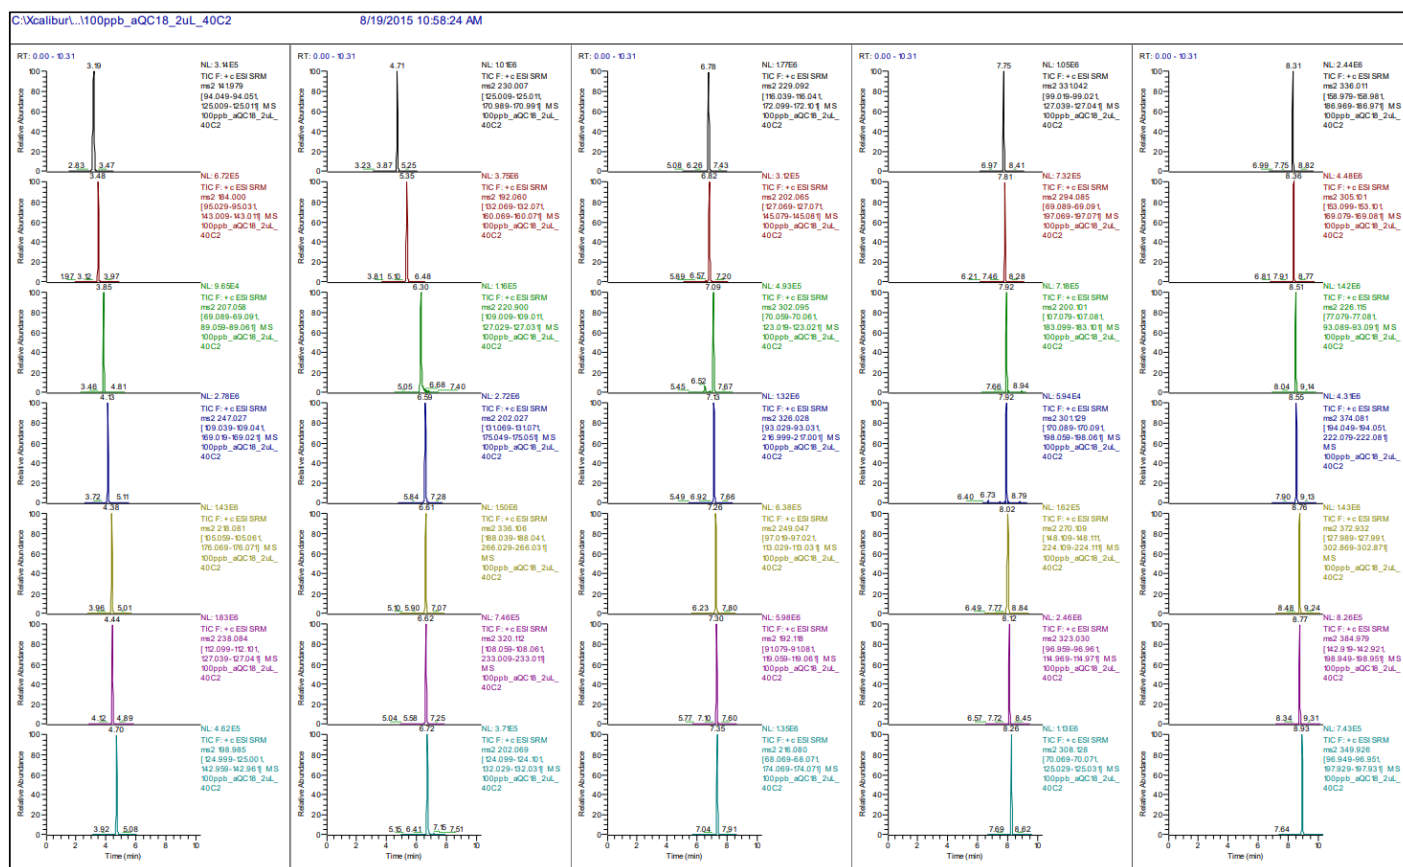

Blueberry samples were fortified with 10 ng/g and 50 ng/g of pesticides, and underwent the AOAC QuEChERS extraction and dSPE cleanup with 150 mg MgSO₄, 50 mg PSA, 50 mg C18, and 7.5 mg GCB (D) or 50 mg ChloroFiltr® (E) as described above. The mean recoveries and RSD% of 6 replicated samples are listed in the table below.

Accuracy and Precision of Pesticides in Spiked Blueberries

The recoveries of several pesticides such as pymetrozine, carbendazim, thiabendazole, and cyprodinil, were found to be adversely affected by GCB, but unaffected when ChloroFiltr® was used; therefore, this sorbent combination was selected for blueberry extract cleanup in the final optimized procedure. The graphs below demonstrate the recovery comparison using GCB versus ChloroFiltr® at 2 contrasting levels (10 and 50 ng/g).

Matrix-matched Calibration Curve of Cyprodinil ($R^2 = 0.9998$)
